

Churn Analysis & Customer Intelligence

1. The Business Challenge

In the hyper-competitive OTT landscape (Netflix, Hotstar, Prime), retention is the only way to survive. You will act as a Data Analyst tasked with identifying high-risk subscribers using a multi-dimensional dataset (Customer demographics, Subscription tiers, and Support escalations).

2. Core Tech Stack

SQL & Python Integration (*numpy, pandas, sqlite3, matplotlib, seaborn*), Performance Engineering (*data cleaning, feature engineering, analytics*), Behavioral Visualization, Writing Actionable Insights

3. Project Milestones

- Relational Data Extraction: Connecting Python to SQL databases to pull multi-table datasets.
- Advanced Feature Engineering: Data imports, calculating tenure, churn rates, and customer aging.
- Executive Reporting: Translating technical findings into billion-dollar business insights.

Note: *This isn't just a coding exercise, it's a business solution. You'll leave with a portfolio-ready project applicable to **E-commerce, SaaS, Fintech and Adtech** industries.*

Churn Analysis - Roadmap

- **Connect** SQL database to Python – **pandas** and **sqlite3**
- Data **import** using SQL query in Python – **pandas** and **sqlite3**
- Data **Cleaning** – **numpy** and **pandas**
 - data types, rename cols, select specific cols, QCs, handle missing/null values
- **Feature Engineering** – **numpy** and **pandas**
 - Create new calculated cols, data transformation, use filters
- Data **Analysis** – **numpy** and **pandas**
 - EDA - aggregation, group by, pivot table
- Data **Visualization** – **matplotlib** and **seaborn**

Churn Definition by Business

Churn analysis is the process of figuring out why customers stop doing business with you.

For this, we only need to look at three things:

- **"Who"**: Identifying which customers left or will leave in future
- **"Why"**: Analyzing their behavior before they left.
- **"When"**: Finding the "danger zone" – point when a user leave

Business Type	Churn Definition
SaaS	Subscription canceled
E-commerce	No purchase in 90 days
Adtech	Using service/app in 90 – 120 days
Streaming	Membership inactive
Telecom	Account terminated
Banking	No transactions for X months

Database Tables

Calculated metrics

KPI	Formula
churn rate	churned customer / total customers
Churn by plan type	churn rate GROUP BY plan_type (Basic/Standard/Premium)
Churn by state	churn rate GROUP BY country, state
Retention rate	1-churn rate
ARPU	SUM(monthly_charges) / COUNT(active customerid)
Average customer tenure	AVG(DATEDIFF(cancellation_date OR NOW(), subscription_start_date))
Revenue at risk	SUM(monthly_charges) WHERE churn_score > 70
Escalation rate	SUM(escalations) / COUNT(complaints) × 100
Avg complaints per customer	COUNT(complaints) / COUNT(DISTINCT customerid)
Correlation: escalations → churn	churn rate WHERE escalations ≥ 1 vs 0

Insights

Insights

- Churn Rate: 28.6% | Retention Rate: 71.4%
- Most of the churn is from basic subscription plan – nothing to worry in terms of major revenue impact
- Most of the churn happened in the month of Sep 2024 and, most affected state is Karnataka
- Average Tenure (Days): 1,451 | ARPU is Rs 18.8
- Total Revenue = 395
- Revenue loss due to churn = 74 | CLTV Lost = 2,047
- % Revenue loss = 18%
- monthly vs annual churn = 55.6% vs 8.3%

Action Items

- Check what happened in Karnataka – was there any increase in price, user complaints, tech issues, etc
- Did we increased subs price for **Basic plan** or recently made any changes – specially in sep month?
- Check what competitor is doing – bcoz one user has moved to competitor
- Focus on customers with 'High' & 'Med' churn risk, check their LTV (to make priority list), complaint request, reach out to them through email, sms, calls and fix their issue.

Portfolio Project - Summary

- **Churn & Revenue Impact** [*\(general summary\)*](#)

Engineered an end-to-end churn analytics pipeline for an OTT subscription platform by integrating multi-table subscriber data across acquisition type, contract structure, and plan tier (**20+ KPIs**). Uncovered a significant churn disparity between monthly and annual contract segments, quantified **MRR** leakage and **CLTV** erosion attributed to **high-risk cohorts**, and delivered a data-backed contract-migration retention strategy to reduce involuntary subscriber loss.

- **Risk Scoring & Segmentation** [*\(Risk Analysis & Segmentation\)*](#)

Developed a multi-dimensional churn risk scoring model by synthesising subscription tenure, plan type, and support escalation signals across three relational tables (**20+ KPIs**), segmented the customer base into risk tiers using composite churn scores, exposed a significant **lifetime** value gap between churned and retained cohorts, and recommended prioritising Premium annual-plan retention over Basic monthly acquisition to maximise long-term revenue yield.

- **Churn & Revenue Impact** [*\(general summary + with numbers from dataset\)*](#)

Engineered an end-to-end churn analytics pipeline for an OTT subscription dataset (20+ KPIs), identifying a 28.6% overall churn rate and surfacing that monthly-contract subscribers churned at 55.6%, which is 6.7 times the 8.3% annual-contract rate- directly attributing \$73.94/month in MRR leakage and \$2,047 in CLTV erosion to six at-risk customers, enabling a targeted contract-migration retention strategy.
